### Summary of Other Geometry Problem solvers

In all honesty there is nothing quite like the assigned geometry problem solver: two triangles with five intersections. There are plenty of complete triangle problems solvers, but none with such specificity and multitude of shape. Every problems solver that does exist for the two triangles with five intersections is customizable or codeable. For example, the only program that can solve the exact problems is Mathematica. Mathematica needs to be coded, the same way python has to be coded, to solve the problem, but it's a lot easier. It also graphs really nicely too and can solve any multishape problem. Mathematica is an even more versatile solver than the one where are making. It is designed to solve any math problem.
